Roger K. Leir : The Aliens and the Scalpel : Scientific Proof of Extraterrestrial Implants in Humans (New Millennium Library, V. 6) before purchasing it in order to gage whether or not it would be worth my time, and all praised The Aliens and the Scalpel : Scientific Proof of Extraterrestrial Implants in Humans (New Millennium Library, V. 6):

"Alien Autopsy" was a Hoax - but THIS is a Book Worth a Look By with a K If you're like me, you remember watching "Alien Autopsy" - probably with friends, some of whom were true believers while others scoffed. Now, I do believe there is far more to heaven and earth, Horatio, than the nightly news tells us - but even I scoffed at "Alien Autopsy". It was fun viewing, but purely entertainment, after a fashion. Now that I have that bit of a disclaimer out of the way, this is a book worth a look! First, an actual doctor, in collaboration with other doctors, is the one writing and investigating claims of implants by aliens. And there are actual artifacts that have been removed and examined. Don't want to spoil it for those likely to read this book, so I'll stop here and just say that if your mind is open, and you've ever asked, "If all the alien stuff is true, why isn't there any actual evidence?" Well, this is a book for you! Enjoy. 14 of 29 people found the following review helpful. Interesting information, but HORRIBLY written By A Customer I was really looking forward to reading this book, but, unfortunately I was unable to complete it. There is some really interesting information buried in the book, however it is so horribly written that I had to put it down half way through; I just couldn't stand it anymore! It is obvious that the author sat with a thesaurus next to him as he wrote, therefore the diction sounds stilted, and even cartoonish at times. Furthermore, the sentences are very choppy, and interesting passages are cluttered with extraneous information, such as the author calling his wife to let her know he'll be home late for dinner. It is also distracting that every conversation is reported with quotes and extra detail, as if dictation were being taken at all times. We know this is not the case, therefore the reader cannot help but question the veracity of what else is being reported. In short, the author fails to achieve true credibility, simply because he invents unnecessary quotes and cannot compose a well-written sentence. What this book really needs is an editor, however somehow, it seems to have escaped all such efforts. If you can stand the atrocious writing "style" (and I use that term lightly), by all means, buy and read this book. The concepts presented are interesting, however if the book aims to reveal long-hidden truths about the existence of aliens, it will fall short. No credible group or authority would ever accept information from such a shoddily composed source. 10 of 11 people found the following review helpful. A genuinely interesting account. By A Customer Even someone like me, who is an 'open minded skeptic' on the UFO phenomenon, found this book a fascinating read. I liked the human angle of Dr. Lier's account; how he tackled the problems of pursuing pioneering research with few resources of his own, and all the difficulties he faced along the way. I don't think anyone can have much doubt about the integrity of his work. But it's another issue as to whether he has indeed found hard scientific evidence for so called 'alien implants' placed in the human body. I found the evidence presented was compelling, but still left room for doubt as to an 'extraterrestrial' origin. Despite all the hard work Dr. Lier has done, I think there is still that 'last mile' to go before this world will be convinced these are truly 'other worldly' objects. But well done Dr. Lier for getting this far! (A minor niggle: I have the paperback version of this book, the technical reports published in the appendices are fuzzily printed and hard to read).

This compelling and intriguing work takes a serious look at the scientific and medical aspects of the alien abduction phenomena. It is a story of not only scientific research but explains how the author, who started as the consummate scientific skeptic, became thoroughly convinced that humans all over this planet are being tampered with by another intelligence. He also believes that our historical record proves this has gone on for thousands of years. This is more than a story of scientific research as it reaches into the very depths of the author's thoughts as he travels down the hard and torturous road of investigative procedure. For the first time he tells of his own involvement with the Near Death Experience and explains the details of these events. He also describes what may very well have been a personal experience involving the alien abduction phenomena. The book brings out the human side of all those who participated in the surgical quest for knowledge. This includes the personal feelings of his patients who are considered the most precious component of this story. In addition it will take the reader on a journey through not only the surgeries themselves but will also illustrate the practical aspects of biological and metallurgical research. The author is a Podiatric Physician and Surgeon who has been in private practice for thirty four years. He was urged by his family and particularly his very close cousin, Dr. Kenneth Ring, author and leading authority in Near Death Experience, to pursue this investigation into the alien abduction phenomena. It has been said by those who have read this manuscript, "This book should be on everyone's reading list and the shelves of every home and public library."

An engrossing and compelling account of the research for hard evidence of extraterrestrial involvement in human affairs--and bodies. If Leir's evidence means what he thinks it does, it has soul-shattering cosmological and religious implications. In any event, Aliens and the Scalpel deserves careful consideration from scientists and lay persons alike who, like Leir, are drawn to seek out the physical traces apparently left behind, like so many tantalizing clues, by the elusive phenomenon we all seek to understand--UFOs. -- Dr. Kenneth Ring, Professor Emeritus of Psychology, University of Connecticut Dr. Leir is to be praised for pioneering research into the removal and analysis of suspected alien implants. Only peer review and acceptance separate his findings from being the proverbial smoking gun of physical evidence for the UFO abduction phenomenon. -- Raymond Fowler, well-known UFO researcher, author of the Andreasson series and the Allagash Abductions Dr. Roger K. Leir is a pioneer in the surgical removal of what seem to be alien implants from humans reporting alien abduction experiences. Determining the purpose of these implants

hinges upon microscopic analysis of the removed specimens. Medical doctors, surgeons, physicists and chemists who are part of the Mutual UFO Network's Board of Consultants are available to apply their expertise to the challenge of resolving this intriguing enigma. -- Walter H. Andrus, Jr., International Director, Mutual UFO Network, Inc. Dr. Roger Leir has finally and dramatically laid his cards on the table. His carefully documented surgical removal of possible alien implants from individuals reporting UFO abductions can no longer be ignored. It may very well turn out to be an event of extraordinary importance. At the very least, *The Aliens and the Scalpel* should alert the scientific community to something skeptics have long denied: the existence of testable physical evidence. Thus it is my hope that the book will have an even wider readership among physical scientists than among those of us already persuaded by the many types of evidence supporting the reality of UFO abductions. -- Budd Hopkins, abduction researcher and author of *Missing Time*, *Intruders*, and *Witnessed* Is it conceivable that aliens are capable of entering our homes, abducting us, and implanting objects into our bodies in a way that is nearly undetectable? The evidence is what appears to be the implants themselves—tiny metallic objects of mysterious composition, surgically removed from the bodies of individuals with alien abduction histories. Eight such persons have undergone meticulously documented surgeries, and the foreign objects removed have been analyzed in double-blind studies by some of the nation's foremost research laboratories. This book is the personal story of the doctor who performed the surgeries, and includes an eight-page section of detailed color photographs and two appendices of biological and metallurgical lab reports. The case as presented is quite convincing, and should generate a good deal of controversy. If its claims are true, it poses far more challenging questions than it answers. -- NAPRA ReView, January 1999. We do not review most books we read favorably. But we reserve the limited space of the pages of the *Meta Research Bulletin* for reviews of those books that contain something paradigm-changing, yet well-documented and in accord with the principles of scientific method. Frankly, that such criteria would be met by a book on the subject matter of "alien implants" was, to put it mildly, unexpected. This book is an easy read because it is done in the anecdotal style of a personal diary. The author takes us through the events in his life over the past three years, starting with his professional career as a friendly neighborhood foot doctor. He describes his evolution to his present status as the only surgeon to surgically remove implants from the bodies of individuals who claim to be alien abductees, then to have those implants analyzed by professional laboratories. The analyzing laboratories were given minimal information, such as "foreign object from foot lesion" or "soft tissue, adjacent to foreign body". The actual biopsy reports, pathology reports, and metallurgical analyses on laboratory letterhead are reproduced as appendices at the book's end. The surgery and lab reports led to several principal conclusions: Almost all the specimens fluoresced under ultraviolet light. All subjects displayed abnormal reactions to procaine local anesthetics. The exterior skin showed no evidence of an entry wound that could have allowed the implant to gain entrance. The implants were encased in a hard membrane of unique composition that could not be cut with a surgical tool. The surrounding tissues were rich in nerve proprioceptors. The normal purpose of such receptors is to convey pressure, temperature, and contact information from surface tissues through the spinal cord to the muscles in the lower extremities. But the implants all came from deep tissues. No known purpose is served by such receptors in deep tissue. The tissue samples completely lacked visible microscopic inflammation. This is normally a medical impossibility, because any foreign body would inflame the surrounding tissues. The final conclusions concerned the composition of the implants themselves. Compositions varied, but aluminum, calcium, copper, and iron were common. One laboratory analyzed four samples, and concluded that two of them "show some isotopic ratios consistent with an extraterrestrial origin." What I read in this book is evidence that cannot be dismissed by the criteria of scientific method. I, for one, will now be paying close attention to future developments. -- Tom van Flandern, *The Meta Research Bulletin*, Washington, DC January 1999 "NBC Special to Air Surgical Removal of Purported Implants" by Jack Carlson The problem of possible alien implants has been looked into by researchers Derrel Sims and Roger Leir, the latter of whom, a podiatrist, has helped perform surgeries to remove objects from patients who claim alien abduction. Author Whitley Strieber, who wrote the bestseller *Communion* and two subsequent books dealing with his own abduction story, was present during the initial series of surgeries performed by Leir/Sims in 1996. In his new book *Confirmation*, published earlier this year, Strieber discusses the results of these surgeries, including subsequent revelations regarding the implants. Now, a new two-hour NBC special, due to air in February, will broadcast the most recent surgery performed by the Leir/Sims team this past August. Dr. Leir invited over 20 guests to witness the surgery as it transpired, arranging for a TV monitor to be set up in a waiting room located near the surgery room so the guests could get a clear, unobstructed view of the actual operation. There were two video cameras used to record the event; NBC had their own crew and Leir/Sims were also taping the proceedings. The patient was Paul Dering (pseudonym), a man of 45-plus years who had a foreign object lodged in his left thumb, which was discovered when he had his wrist X-rayed as a result of a skiing accident in 1990. An emergency room doctor showed him the X-ray, which revealed a tiny opaque object in his left thumb. Shocked by the X-ray, Dering had no idea how the object had become embedded into the flesh of his thumb, nor could he recall ever having injured his thumb or cut it to a degree that would have allowed such an object to insert itself. He had never had surgery on his thumb; no scar tissue was present and no unusual experience either from childhood or the military could account for the presence of this object which had now, for the first time, revealed itself on a piece of X-ray film. When Dering consulted his local HMO, they

told him they couldn't treat him, since the problem did not represent any kind of life-threatening situation. Dering accepted that explanation and decided not to pursue the matter further: nevertheless he was not able to forget the mysterious foreign object in his thumb. A few years later, Paul attended a MUFON (Mutual Unidentified Flying Object Network) meeting to hear a lecture by Dr. Leir, who described his previous work. With the assistance of his partner Sims and their surgical team, Dr. Leir had successfully removed foreign objects from the hands and feet of several patients. About six weeks later, Dering made an appointment with Dr. Leir, who examined the X-rays and arranged to have additional ones taken, to make certain that the object was indeed still there and had not moved. Both sets of X-rays confirmed that some type of foreign object was embedded within the flesh of Dering's left thumb. -- Jack Carlson

From the Preface: Sometimes the whole world knows when a historical figure makes his history. As often, though, people whose work is little known make history in the quiet of ordinary life. Dr. Roger Leir is such a historical figure. There will come a time when the extraordinary breakthrough that he has made is noted in every textbook, but right now most of the world still has no idea of what he did, or even that such a thing could be possible. -- Whitley Strieber, author of *Communion, Transformation, Confirmation*

The problem of possible alien implants has been looked into by researchers Derrel Sims and Roger Leir, the latter of whom, a podiatrist, has helped perform surgeries to remove objects from patients who claim alien abduction. Now, a new two-hour NBC special will broadcast the surgery performed by the Leir/Sims team in August, 1998. Dr. Leir invited over 20 guests to witness the surgery as it transpired, arranging for a TV monitor to be set up in a waiting room located near the surgery room so the guests could get a clear, unobstructed view of the actual operation. There were two video cameras used to record the event; NBC had their own crew and Leir/Sims were also taping the proceedings. The patient was Paul Dering (pseudonym), a man of 45-plus years who had a foreign object lodged in his left thumb, which was discovered when he had his wrist X-rayed as a result of a skiing accident in 1990. An emergency room doctor showed him the X-ray, which revealed a tiny opaque object in his left thumb. Shocked by the X-ray, Dering had no idea how the object had become embedded into the flesh of his thumb, nor could he recall ever having injured his thumb or cut it to a degree that would have allowed such an object to insert itself. He had never had surgery on his thumb; no scar tissue was present and no unusual experience either from childhood or the military could account for the presence of this object which had now, for the first time, revealed itself on a piece of X-ray film. A few years later, Paul attended a MUFON (Mutual Unidentified Flying Object Network) meeting to hear a lecture by Dr. Leir, who described his previous work. With the assistance of his partner Sims and their surgical team, Dr. Leir had successfully removed foreign objects from the hands and feet of several patients. About six weeks later, Dering made an appointment with Dr. Leir, who examined the X-rays and arranged to have additional ones taken, to make certain that the object was indeed still there and had not moved. Both sets of X-rays confirmed that some type of foreign object was embedded within the flesh of Dering's left thumb. At Dr. Leir's suggestion, Dering met with Sims several weeks later. Sims confirmed that the "object" appeared similar to others the team had previously removed, and possibly had been implanted by an encounter with some type of alien. Both Sims and Dr. Leir recommended surgery to remove the object. Details were worked out during the ensuing weeks. The surgery was to take place at a Simi Valley surgical center. A Dr. Ablemeiser (pseudonym), a general surgeon and friend of Dr. Leir, would perform the operation. An NBC crew attended to get the event on tape. The patient was brought into the surgery room. Sims, a hypnoanaesthesiologist, began his hypnotic procedure which would insure that Dering would feel no pain during any phase of the operation. A medical anesthetist, also present, administered a local anesthetic. A special X-ray machine called a "C" Arm was used during the procedure to pin-point the position of the object before its extraction. Once the foreign object was located on the screen of the X-ray, Dr. Ablemeiser made an incision with his scalpel. The object was quickly located and extracted. Dr. Leir examined the object and informed his audience that it was "strikingly similar in appearance and size to several other objects" they had previously removed. Resembling a cantaloupe seed, the tiny object was covered with a dark, grey shiny membranous tissue. It was placed in a vial containing the patient's own blood serum, sealed and dated. Several days later, a member of the NBC team arranged to have the vial transported by bonded courier to the University of Texas' division of Earth and Physical Sciences in San Antonio, Texas, where it was initially analyzed. According to Dr. Leir, the security precautions were necessary to prevent any contamination of the specimen and to protect the integrity of the entire procedure. All of these steps were recorded by the network TV cameras. "The object will eventually be subjected to a variety of tests," Dr. Leir comments. "The results of first analysis reveal that the implant bears close resemblance to the other implants removed in the 1995 and 1996 surgeries." Seven additional surgeries had been performed prior to the August 17 surgical removal on Dering. Three out of the eight patients turned out to have nearly identical, highly anomalous iron-alloy objects involved. Dr. Leir comments, "In all cases, ultra-hard, metallic, highly magnetic 'cores' were surrounded by an ultra-dense dark grey membrane which could not be cut with a brand new scalpel. We know this had a magnetic iron core that was polar, since we used a magnet to spin the object 360 degrees without touching it. This was recorded by the NBC camera. The membrane somehow prevented any sign of inflammation or rejection." The team believes the objects are of "alien" origin. As Leir explains, "The two main reasons for considering the elements in these objects to be non-terrestrial in origin has to do with the comparison by the metallurgical scientists to meteorite fragments, and that the isotopic ratios of some of the elements are [too] far out

of the...range [for them]to be terrestrial in occurrence." A complete accounting of all previous surgeries, including histories of some of the patients is available in a new book, *The Aliens and the Scalpel*, authored by Dr. Roger Leir and published by Granite Publishing, with sponsorship from The National Institute for Discovery Science and the Bigelow Foundation. -- Jack Carlson, *UFO Magazine and Phenomena Report*, Vol. 14, No. 1, January 1999, pp. 22-25

From the Publisher Eight meticulously documented surgeries on persons reporting alien abduction experiences has yielded a consistent yield of anomalous objects. Metallurgical analysis at the world's finest laboratories indicates that the structure of these objects has an extraterrestrial origin. The composition of the objects includes metals whose isotopic ratios are clearly not from Earth. Moreover, the form of these objects is clearly engineered and manufactured with precision rather than being a naturally occurring form. If these scientifically derived results are not disproven by subsequent analysis, then we can firmly conclude that some individuals with alien abduction histories have artificially manufactured objects in their bodies of a demonstrably extraterrestrial origin. In short, we now have the "smoking gun" of ufology-hard, physical, scientific evidence of a continuing alien presence on Earth!

From the Author My intention in writing this book is to provide a clear, concise account of how I applied my skills in medicine and science to a phenomenon that has not been looked at seriously by the scientific and medical establishments. This resulted in the most astonishing findings of any related research to date. Yes, there have been many investigations of UFOs and hundreds of books and articles written about the phenomenon. And, yes, there have been a few notable scientists who have performed some of those investigations, such as astronomer Dr. J. Allen Hynek, atmospheric physicist Dr. James D. MacDonald, computer scientist Dr. Jacques Valle, psychiatrist Dr. John Mack, M.D., and nuclear physicist Dr. Stanton Friedman. But fifty years after the modern UFO era began, the phenomenon remains mysterious, because, for the most part, mainstream science and medicine regard it and its study as foolish, fringe pseudoscience. If the field were to be studied seriously by those establishments, there would be multi-million dollar funding of a well-planned and coordinated global research effort. Instead, ufology gets along as best it can with minimal funding raised largely by public membership in various UFO research organizations and by small grants to individuals from daring philanthropic individuals and funds. The story of my own research efforts is one of coincidence, driving curiosity and struggle against numerous obstacles, including the search for funding. I don't mean to glorify myself or make grandiose claims, yet I feel in all honesty and humility that I have made a significant breakthrough in solving the question "Are we alone in the universe?"

Harvard psychiatrist John Mack, whom I noted above, writes in his book *Abduction: When we explore phenomena that exist at the margins of accepted reality, old words become imprecise or must be given new meanings. Terms like "abduction," "alien," "happening," and even "reality" itself, need redefinition lest subtle distinctions be lost. In this context, thinking of memory too literally as "true" or "false" may restrict what we can learn about human consciousness from the abduction experiences that I recount in the pages that follow. In using the medical-surgical approach to the phenomenon known as alien abductions, I too have stepped into that realm where conventional terms become imprecise and must be carefully redefined in order to describe experiences that seem so far from everyday reality. This narrative takes you, the reader, along with me on a journey into the unknown. I present my thoughts as various experiences occurred and decisions were made by me to go forward into a mystery. I also recount the actual statements of the abductees on whom I performed the surgeries.*
